# The Social Golfers Problem

**Figure:** A group of 16 friends wants to organize a golf tournament.

- 4 teams of 4 golfers would play over 3 rounds.
- For every round:
  - Each golfer can only play once per round.
  - Each golfer must play with golfers he has never played with before.

---

<sup>1</sup>Picture from [harbourridge.com](http://harbourridge.com).

# A Social Golfers model formulated with sets

- A *team* is a set of 4 golfers, a *round* is an integer in 1..3.

- **Decision:** Teams of golfers per round.

An array of  $[round \times team] : round\_team\_golfers$

- **Constraints:**

- Each golfer can only play once per round:

$$\forall r \in round : |\bigcap_{t \in team} round\_group\_golfers_{r,t}| = 0$$

- Each golfer must play with golfers he has never played with before:

$$\forall r_1 < r_2 \in round, \forall t_1, t_2 \in team :$$

$$|round\_group\_golfers_{r_1,t_1} \cap round\_group\_golfers_{r_2,t_2}| \leq 1$$

# A Social Golfers model formulated without sets

- A *team* is an *array* of 4 golfers, a *round* is an integer in 1..3.
- **Decision:** Teams of golfers per round.  
An array of  $[round \times team] : round\_team\_golfers$
- **Constraints:**
  - Each golfer can only play once per round:  
 $\forall r \in round, \forall i \in 1..(|round\_group\_golfers_r| - 1),$   
 $\forall j \in (i + 1)..|round\_group\_golfers_r| :$   
 $concatene\_all(round\_group\_golfers_r)_i \neq$   
 $concatene\_all(round\_group\_golfers_r)_j$
  - Each golfer must play with golfers he has never played with before:  
 $\forall r_1 < r_2 \in round, \forall t_1, t_2 \in team, \forall g \in golfers, :$   
 $occurence(g, ($   
 $concatene(round\_group\_golfers_{r_1, t_1}, round\_group\_golfers_{r_2, t_2})$   
 $)) \leq 1$

# Automatic set encoding

- Set models feels more natural and expressive.
- Many solvers on the market do not feature making decisions about sets.
- Can we automate set encodings for those solvers? How efficient would it?
- We propose a library that automatically encode sets.

# Global Constraints

- Global Constraint are powerful high level constraints that can constraint  $n \geq 1$  variables *simultaneously*.
- `element( $i$ ,  $Tab$ ,  $val$ )`:  
 $val$  is equal to the  $i^{th}$  item of  $Tab$ .
- `all_different( $Vars$ )`:  
Enforce all variables of the collection  $Vars$  to take distinct values.
- `global_cardinality( $Vars$ ,  $Vals$ ,  $Noccurs$ )`:  
Each value  $Vals_i$  (with  $i \in 1..|Vals|$ ) should be taken by exactly  $Noccurs_i$  variables of the  $Vars$  collection.

`global_cardinality([3, 3, 8, 6], [3, 5, 6], [2, 0, 1])`  
 $Vars$ 
 $Vals$ 
 $Noccurs$

Figure: MiniZinc

# Set variable

## Definition

A set domain  $D$  is a set of sets containing all possible set values of a set variable  $s$ .

A set variable is decided over its set domain  $D$ .

**Figure:** A visualization of a set domain  $D$  with its set elements  $D_e$

# Conjunto set representation

## Definition

A *set interval*  $I$  defines a lattice of sets, partially ordered by set inclusion, such that  $I = [glb, lub]$ , with  $glb = \bigcap_{i=1}^n D_i$  the intersection of all sets inside  $D$ , and  $lub = \bigcup_{i=1}^n D_i$  the union of all sets inside  $D$ .

## Definition

The *cardinality*  $C$  of a set variable  $s$  ranges in the integer domain  $C_{min}..C_{max}$ , where  $C_{min} = card(glb(s))$  and  $C_{max} = card(lub(s))$ .

Conjunto<sup>4</sup> represents a set by a greatest lower bound  $glb$ , a least upper bound  $lub$ , a lower bound cardinality  $C_{min}$ , an upper bound cardinality  $C_{max}$ .

---

<sup>4</sup>Carmen Gervet. "Conjunto: constraint logic programming with finite set domains". In: *ILPS*. 1994.

# Conjunto set representation

(a) Set variable  $s_1$  range over  $I_1$ ,  
the convex enclosure of  $D_1$

(b) Lattice representation of  $I_1$

Figure: Two different visualisations of  $I_1$

# Boolean set encoding

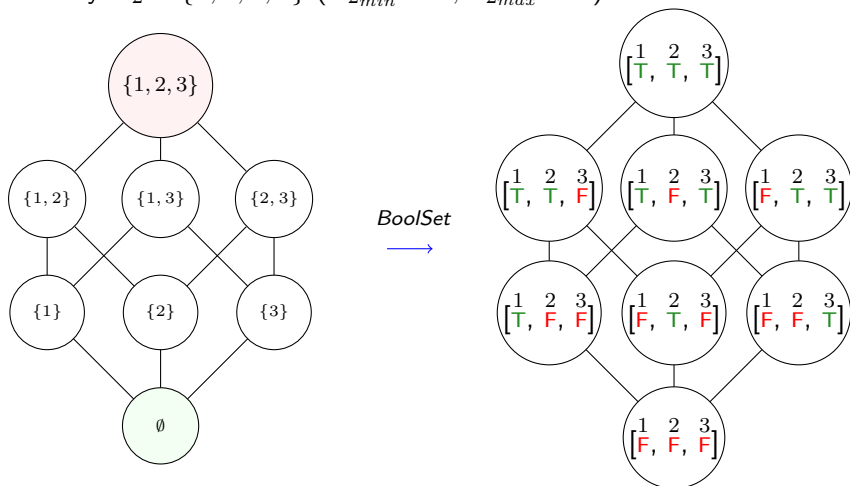

- Array representation: breaks symmetric set representation
- Let  $s$  be a set variable with a domain  $D$ . Let  $f_B$  be the function which encode a set into an array of Boolean variables. Let  $f_B^{-1}$  the reverse function of  $f_B$ .  $xb$  is the array of Boolean variables encoding  $s$  such that:

$$\begin{aligned}f_B(s) &= x \\f_B^{-1}(xb) &= s \\xb_i = true &\Leftrightarrow i \in s, \forall i \in 1..card(s) \\xb_i = false &\Leftrightarrow i \notin s, \forall i \in 1..card(s)\end{aligned}$$

- Encoding name: *BoolSet*

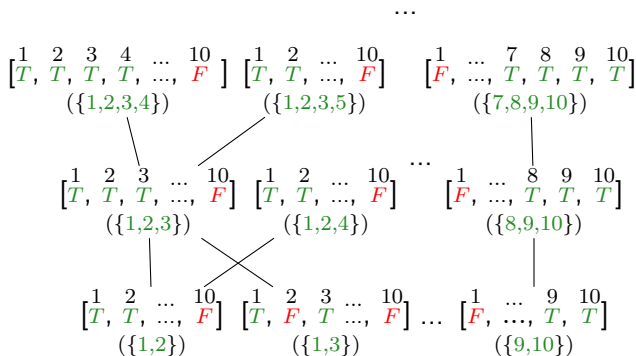

# BoolSet encoding: Example 1

Let consider a set  $s_2$  with a domain  $D_2 = \mathcal{P}(\{1, 2, 3\})$  and a variable cardinality  $C_2 \in \{0, 1, 2, 3\}$  ( $C_{2_{min}} = 0, C_{2_{max}} = 3$ )

## BoolSet encoding: Example 2

Let consider a set  $s_3$  with a domain  $D_3 = \mathcal{P}(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\})$  and a variable cardinality  $C_3 \in \{2, 4\}$  ( $C_{3_{min}} = 2, C_{3_{max}} = 4$ )

- BoolSet requires to create an array containing 10 Boolean variables.
- CardSet, only needs  $C_{max}$  variables.

# Table of Contents

1 Introduction

3 Experimental results

4 Conclusion

# Cardinality set encoding

- Given a set variable  $s$  with a domain  $D$  and  $C_{min}$  and  $C_{max}$  respectively the minimum and maximum possible cardinality of  $s$ .  $f_C$  is the function that encodes a set into an array of integer variables.  $f_C^{-1}$  is the reverse function of  $f_C$ . Let  $y$  be the array of integers encoding  $s$ . We define  $m = C_{max} - card(s)$ , and  $d_i$ , the dummy value for element  $y_i$ , such that:

$$f_C(s) = y$$

$$f_C^{-1}(y) = s$$

$$card(s) \in C_{min}..C_{max}$$

$$y_i = \min(s \setminus \bigcup_{j=1}^{i-1} s_j), \forall i \in 1..card(s)$$

$$y_j = d_k, \forall j \in (card(s) + 1)..C_{max}, \forall k \in 1..m$$

- Encoding name: *CardSet*.

# CardSet algorithm

- $f_C$  is named SET2INT.
- The “extra elements” of  $xi$  that do not represents any value in  $s$  are *dummy* elements.

---

## Algorithm SET2INT

---

**Require:** A set  $s$

**Ensure:** An array of integers  $xi$

- 1: CONSTRAINT  $C = \text{card}(s)$
  - 2: CONSTRAINT  $C_{min} = \text{lower\_bound}(C)$
  - 3: CONSTRAINT  $C_{max} = \text{upper\_bound}(C)$
  - 4: CONSTRAINT *dummies* be the set of the possible dummy elements for  $xi$
  - 5: CONSTRAINT  $xi$  be an array such that  $xi_j \in \text{upper\_bound}(s) \cup \text{dummies}, \forall j \in 1..C_{max}$
  - 6: GLOBAL CONSTRAINT **strictly\_increasing**( $xi$ )
  - 7: CONSTRAINT  $xi_j \notin \text{dummies}, \forall j \in 1..C$
  - 8: CONSTRAINT  $xi_j \in \text{dummies}, \forall j \in (C + 1)..C_{max}$
  - 9: CONSTRAINT  $s = \text{reverse\_set2int}(xi)$
-

# CardSet encoding: Example

Let consider a set  $s_3$  with a domain  $D_3 = \mathcal{P}(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\})$   
and a variable cardinality  $C_2 \in \{2, 4\}$  ( $C_{min} = 2, C_{max} = 4$ )

# Dummy elements

- Set variable with variable cardinality: cannot declare an array of variable size.
- $C_{max} - C$  dummy integers elements outside of  $D$ ?
- Absent value  $\langle \rangle$  is a MiniZinc built-in feature, suitable for our array representation (properties like  $n \langle \rangle \wedge \langle \rangle < n$  are both true, and  $n = \langle \rangle$  is false, will simplifies operations involving multiple sets)
- $C_{max} - C$  dummy absent elements?
- Which one is better? Dummy integers create *fake overlaps* but allows us to easily constraint the strictly increasing values. Optional values are not supported by all global constraints but avoid *fake overlaps*.
- Both encoding have been implemented.

# Set variable constraints encodings

- Set variable membership
- Set variable less or equal
- Set variable intersection and union

# Set variable membership

- $e \in f_C^{-1}(xi) \Leftrightarrow \bigvee_{i \in 1..|xi|} xi_i = e$
- |             |             |     |             |
|-------------|-------------|-----|-------------|
| 1           | 2           | ... | $ xi  + 1$  |
| $xi_1 = e?$ | $xi_2 = e?$ | ... | <i>True</i> |
- `arg_max(a)` return the index of the max value of an array *a*.

---

SET\_IN

---

**Require:** A set *s*, a value *e*

**Ensure:** *e* belongs to *s*.

- 1: CONSTRAINT  $xi = \text{set2int}(s)$
  - 2: CONSTRAINT  $\forall j \in \text{index}(xi), \text{arr\_}b_j = (xi_j == e)$
  - 3: CONSTRAINT  $\text{arr\_}b_{\text{index}(xi)+1} = \text{True}$
  - 4: GLOBAL CONSTRAINT  $\text{arg\_max}(\text{arr\_}b) \leq \text{card}(s)$
- 

(b) Venn Diagram of  $D_x$ , with  $e_1, e_2$  two elements

# Set variable less or equal

- $s_1 \leq s_2$  means  $s_1$  is *lexicographically* less or equal to  $s_2$ .
- GLOBAL CONSTRAINT `lex_lesseq(u)` with  $u$  the concatenation of the *CardSet* representation of  $s_1$  and  $s_2$

---

## Algorithm SET\_LE

---

**Require:** A set  $s_1$ , a set of value  $s_2$

**Ensure:**  $s_1$  is lexicographically less or equal to  $s_2$ .

```

1: if  $ub(s_1) = \emptyset$  then
2:   return True
3: else if  $ub(s_2) = \emptyset$  then
4:   CONSTRAINT  $s_2 = \emptyset$ 
5: end if
6: CONSTRAINT  $xi = \text{set2int}(s_1)$ 
7: CONSTRAINT  $yi = \text{set2int}(s_2)$ 
8: GLOBAL CONSTRAINT lex_lesseq(xi, yi)

```

---

# Set variable intersection and union

- Let  $s_3 = s_1 \cap s_2$ ,  $s_4 = s_1 \cup s_3$
- Counting common elements *noccurs* of  $u = (xi, yi)$  with the `global_cardinality` constraint.
- $noccurs_i = 2 \Leftrightarrow D_{xy_i} \in s_3$
- $noccurs_i \geq 1 \Leftrightarrow D_{xy_i} \in s_4$

---

## SET\_INTERSECT

---

**Require:** A set  $s_1$ , a set  $s_2$

**Ensure:** Return the set of common values shared by  $s_1$  and  $s_2$

- 1: CONSTRAINT  $xi = \text{set2int}(s_1)$
  - 2: CONSTRAINT  $yi = \text{set2int}(s_2)$
  - 3: Let  $s_3$  be the resulting set with  $D_3$  its domain.
  - 4: CONSTRAINT  $zi = \text{set2int}(s_3)$
  - 5: CONSTRAINT  $xyi = [xi, yi]$
  - 6: Let *noccurs* be the number of occurrence of each value of  $D_3$  in  $xyi$ .
  - 7: GLOBAL CONSTRAINT  
`global_cardinality(xy_i, D_3, occurs);`
  - 8: CONSTRAINT  $zi_j = D_{3_j}, \forall j : occurs_j \geq 2$
  - 9: CONSTRAINT  $zi_k \in \text{dummies}, \forall k : occurs_k < 2$
  - 10: return  $s_3$
- 

(b) Venn Diagram of 2 set domains,  $D_x$  and  $D_y$

# Global constraints redefinitions

- Disjoint and all disjoint
- Count common element

# Disjoint and all disjoint

- **disjoint:**

- $s_1, s_2$  two sets of domains  $D_1, D_2$
- $|s_1 \cap s_2| = 0$
- $nooccurs = \text{global\_cardinality}([xi, yi], D_1 \cup D_2)$
- $nooccurs_i \leq 1, \forall i \in 1..|D_1 \cup D_2|$

- **all\_disjoint:**

- $S$  is a collection of  $n$  sets  $s_i$  of domains  $D_i$
- $|\bigcap_{i \in 1..|S|} s_i| = 0$
- $nooccurs = \text{global\_cardinality}(\text{array\_union}([xi_k, \forall k \in 1..|S|]), \bigcup_{i \in 1..|S|} D_i)$
- $nooccurs_i \leq 1, \forall i \in 1..|D_1 \cup D_2|$

# Count common elements

- `count_common_element`
  - $s_1, s_2$  two sets of domains  $D_1, D_2$
  - $|s_1 \cap s_2| = n$
  - $nooccurs = \text{global\_cardinality}([xi, yi], D_1 \cup D_2)$
  - `count(nooccurs, 2)`
